

## CP3: Roadmap

### Group Contributions

We will try to debug the CPU as much as possible to see if we are able to successfully run the competition code. As for the report and presentation, we will work on both together. We will have to gather data on the CPU to include in the report and the presentation but overall, all the work is split equally.

### Required Functionalities

For CP4, we need to prepare for the presentation by getting data of how our CPU performs with each advanced feature. We also want to try to understand why there are changes in performance (good or bad), and what we can do to increase performance. We also need to write the report, which requires these performance counters and include them in the report. For the design competition, we're not sure if our CPU can even execute the competition code, let alone CP3 testcode.
